## IN THE CLAIMS

Please amend the claims as follows:

- (Previously Presented) A system for inserting commands into a digital programming signal comprising:
- a digital ad server which generates ad content and at least one message having an attached command, the message being separate from generated ad content; and
- a digital splicer which receives the message from the ad server, extracts the attached command and splices the command into a digital transport stream including program content, the command being inserted separately from the program content in the digital transport stream.
- (Original) The system of claim 1, wherein the message further comprises a message which is in a DVS380 compliant format.
- (Original) The system of claim 2, wherein the DVS380 compliant message includes at least one descriptor.
- (Original) The system of claim 3, wherein the DVS380 message further comprises a DVS380 splice request message.
- (Original) The system of claim 4, wherein the descriptor includes at least one field for inserting a command instruction.
- (Original) The system of claim 5, wherein the descriptor includes at least one field for specifying a time difference from a reference time at which to insert the command into a digital transport stream.

Filing Date: October 29, 2003

Title: System and method for providing triggered event commands via digital program insertion splicing

- (Currently Amended) The system of claim 1, wherein the digital ad server generates at least one message having more than one eemmands-command.
- 8. (Original) The system of claim 1, wherein the message further comprises a delta time indication from a pre-determined reference and the digital splicer splices the command into a digital transport stream based upon a calculation of the delta time with the reference and the current time.
- (Original) The system of claim 1, wherein the command is spliced into the digital transport stream on a frame accurate basis.
- (Original) The system of claim 1, wherein the message is in the DVS380 standardized message format and the command is provided in a descriptor field.
